Health issue could either be a cause or a result of human challenges. In Pakistan, poor health and the spread of communicable diseases are a part of the effects of the flood this summer, but also are becoming the cause of prolonged human suffering, including unemployment, despair and deeper poverty.

Human security is a concept that tries to consider the linkages and interconnectedness of human insecurities, and tries to consider people themselves as the agent to sustain their lives and livelihoods. In this context, health, in both physical and mental terms, plays a pivotal role to promote human security.

This time, the lecturer will try to present the linkages and human factors surrounding GBV (Gender-Based Violence), especially in the case of violence against women in Pakistan. Acid burning and other worst forms of violence is there, and they are deeply connected to the psycho-social parameters of the communities and human behaviors. The lecture tries to explore possible solutions for such violence, both for short and long terms.

**GHP Seminar**

**Human Security, Health and Gender-Based Violence**
